

Dynamic Stochastic General Equilibrium and Business Cycles

Lecture Notes for MPhil Course Macro IV, University of Oxford.

Florin O. Bilbiie¹
Nuffield College, University of Oxford.

2 December 2005

¹There is little to nothing original in these lecture notes; they draw heavily on published work by others, on lecture notes I have studied as a student and on my own research. I thank Fabian Eser for reading a preliminary draft and making comments, John Bluedorn, Chris Bowdler and Roland Meeks for discussions about organizing the material and Fabio Ghironi for sharing his experience in teaching macroeconomics to PhD students.

Contents

Why care? Aim of the course	v
1 What are we trying to explain? Stylised facts	1
2 The Benchmark DSGE-RBC model	5
2.1 Environment	5
2.2 Planner (centralised) economy	6
2.3 Competitive equilibrium (or decentralising the planner outcome)	8
2.4 Welfare theorems	10
2.5 Functional forms	10
2.6 Steady-state and conditions on preferences	11
2.7 Loglinearisation	13
2.7.1 Intermezzo on loglinearisation	13
2.7.2 Loglinearising the planner economy	14
2.7.3 Loglinearising the competitive economy	17
2.8 Calibration	19
2.9 'Solving' the model	20
2.9.1 Solving forward and backward: (local) stability, indeterminacy and equilibrium uniqueness	22
2.9.2 Elastic labor	25
2.9.3 Discussion of solution in general case.	26
2.10 Welfare analysis - a primer	26
2.11 Evaluating the model's performance	27
2.11.1 Measurement of technology	27
2.12 Impulse responses and intuition	29
2.12.1 The role of labor supply elasticity	30
2.12.2 The role of shock persistence	33
2.13 Second moments	37
2.14 What have we learned?	38
2.14.1 Critical parameters	38
2.14.2 The Solow residual	39
2.14.3 Enhancing the propagation/amplification mechanism	40
2.14.4 The role of variable capital utilization	41
2.14.5 Where do we go	43

3	Government Spending and Fiscal Policy	45
3.1	Lump-sum taxes, no debt	46
3.1.1	The labor market	47
3.2	Short detour on asset pricing	49
3.3	Government debt and Ricardian equivalence	51
3.3.1	Debt sustainability	53
3.4	Distortionary taxation and Ricardian equivalence	54
3.5	The effects of government spending shocks under distortionary taxation	55
3.5.1	Debt dynamics and the 'fiscal rule'	56
3.5.2	Crowding-in of private consumption	57
3.6	Back to Asset Pricing. Some extra embarrassment for the frictionless model: The Equity Premium Puzzle	60
A	Refresher: 'solving' a dynamic optimization problem in 2 minutes	65
A.1	Euler Equations in the Deterministic Case	65
A.2	Euler Equations in the Stochastic Case	67
B	Matlab programmes	69
B.1	Matlab code for the baseline, elastic-labor model	69
B.2	Matlab code for variable utilization model	73
