Charles Hilliard Feinstein was born in Johannesburg, South Africa, in 1932 and died on November 27th 2004, aged 72.

Professor Feinstein’s great academic achievement was to calculate the size and structure of the British economy from the time of the Industrial Revolution to the present day. The results of this project were published in 1972 as National Income, Expenditure and Output of the United Kingdom, 1855-1965. This work has proved invaluable in comparing performance of the British economy during these two centuries. This information can then also be compared to the economic performance of other countries. The information has been used by the Chancellor of the Exchequer to measure periods of economic growth. This work was largely undertaken by Feinstein himself, making it all the more remarkable. The papers relating to this work are included in section A of the archive.

Also covered in this collection are papers relating to Feinstein’s specialist work Studies in capital formation in the United Kingdom, 1750-1920. A collaborative work edited by Charles Feinstein and Sidney Pollard. The papers, entitled ‘Gross domestic fixed capital formation’ and found in section B of the archive, are concerned with measuring the extent and composition of the nation’s capital fund and assessing its contribution to the growth of output. Dr. Feinstein, in the final publication, gives a continuous series of national capital formation during the Industrial Revolution, growth during the Victorian era, and the early twentieth century, spanning a century and a half. Thus, the work became a key reference for any scholar studying British investment accumulation from the mid-eighteenth century to the end of World War 1.

The papers (consisting primarily of figures and workings) have been arranged, where possible, to follow the order presented in the final publications and cross-references to chapters in the final publications have been given. Where possible, bibliographic references have been given in this handlist.
